TRABALHO PRÁTICO 2

Bases de Dados e Armazém de Dados

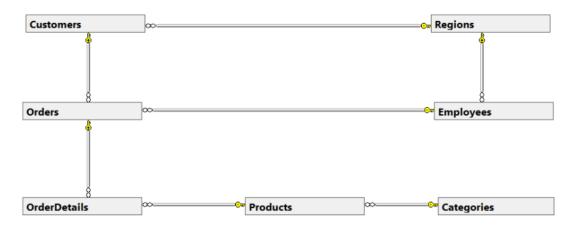

Licenciatura em Engenharia de Telecomunicações e Informática Instituto Superior de Engenharia do Porto Janeiro de 2025

> Luís Paulo Teixeira Oliveira, 1231002 Miguel Fundevila Pinto Da Silva, 1231058 Tiago Dos Santos Oliveira, 1230947

Introdução

O presente relatório pretende descrever a elaboração do segundo trabalho prático realizado no âmbito da unidade curricular de Bases de Dados e Armazém de Dados, para o qual foi proposto o desenvolvimento de um *data mart* a partir de dados respetivos a encomendas de produtos, feitas por clientes de uma dada empresa que comercializa bens alimentares.

Numa primeira fase, analisou-se o modelo de dados relativo ao sistema operacional fornecido e recorreu-se à construção de um modelo dimensional com o objetivo de definir um esquema concetual para o *data mart*.

Arquitetura do data mart

Definição de Data Mart

Um *data mart* é um pequeno armazém de dados focado em apenas um conjunto de factos ligados a uma única área do negócio em questão, neste caso, as encomendas de produtos.

Modelação dimensional

A modelação dimensional de um data mart passa, essencialmente, pela criação de um modelo em estrela baseado em tabelas de factos e tabelas dimensionais (denominadas dimensões ao longo deste relatório). Para tal, seguiu-se a metodologia de modelação dimensional de Kimball, que envolve identificar quatro pontos chave: área de negócio, nível de detalhe, dimensões e factos.

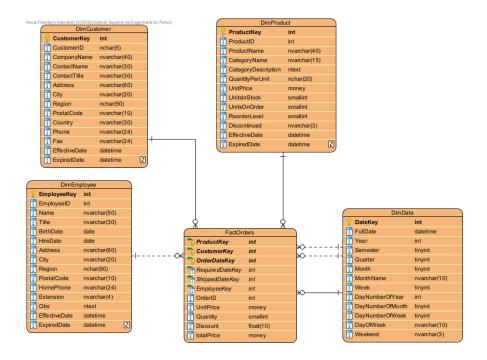

- 1. Área de negócio: gestão de encomendas e vendas;
- 2. Nível de detalhe: encomendas por cliente por produto por data;
- 3. Dimensões: customer, employee, product, date;
- 4. Factos: UnitPrice, quantity, discount, total price.

Seguindo esta metodologia, foi possível identificar que seriam criadas quatro dimensões: a DimCustomer, a DimEmployee, a DimProduct e a DimDate.

Foi também possível definir os factos que constituem a tabela de factos: preço unitário, quantidade, desconto e preço total.

Identificadas as dimensões e os factos, partiu-se para a construção do modelo dimensional. Como é possível constatar, os atributos das dimensões mantêm-se os mesmos das tabelas da base de dados operacional, apenas tendo sido adicionadas *surrogate keys* nas quais se iram basear os joins entre as dimensões e a tabela de factos, em vez de se basearem nas *primary keys* da base de dados operacional, evitando inconsistências no tipo de dados e protegendo o *data mart* de alterações feitas na base de dados operacional.

No caso da tabela de factos, foram selecionadas apenas três das *foreign keys* para serem *primary keys*. Um cliente encomenda um produto num dia a uma certa hora, e se o mesmo produto for encomendado pelo mesmo cliente nesse mesmo dia a hora será diferente (Na tabela do sistema operacional o atributo é apenas date, o que se torna limitativo. Foi assumido como erro).

Estruturas de dados criadas Script de criação da DimCustomer:

```
TE NOT EXISTS (SELECT name FROM sys.tables WHERE name = 'DimCustomer')

BEGIN

CREATE TABLE [abo], [DimCustomer]

(CustomerKey] [aint] IDENTITY(1,1) NOT NULL,

    [ExpireMotte] [datetime] NOLL

CONSTRAINT [PK_DimProduct] PRIMARY KEY CLUSTERED
    [ProductKey] ASC
    [ProductKey] ASC
    [ProductKey] ASC
    [ProductKey] ASC
    [PROMARY]

CREATE NONCLUSTERED INDEX [MonclusteredIndex-ProductID] ON [dbo].[DimProduct]
    [ProductIo] ASC
    [NITH (PAD_INDEX = OFF, STATISTICS_NORECOMPUTE = OFF, SORT_IN_TEMPO8 = OFF, ONLINE = OFF, ONLINE = OFF, ALLOW_ROW_LOCKS = ON, ALLOW_PAGE_LOCKS = ON, OPTIMIZE_FOR_SEQUENTIAL_KEY = OFF)

END
```

Script de criação da tabela de factos, FactOrders:

Staging area

A staging area serve de intermediário entre a base de dados operacional e o data mart, constituindo um ponto onde são aplicados processos de extração, transformação e carregamento que asseguram que os dados carregados contêm o menor número de erros possível.

Estruturas de dados criadas

Script de criação da tabela Categories:

Script de criação da tabela Customers:

Script de criação da tabela CustomersDQP:

```
IF NOT EXISTS (SELECT name FROM sys.tables WHERE name = 'CustomersDQP')
    CREATE TABLE [dbo].[CustomersDQP]
            (
                [CustomerID] [nchar](5),
                [CompanyName] [nvarchar](40),
                [ContactName] [nvarchar](30),
                [ContactTitle][nvarchar](30),
                [Address][nvarchar](60),

Conclusão

Todos os objetivos para o trabalho foram alcançados, tendo sido desenvolvido o data mart na sua totalidade e aplicados os processos de extração, transformação e carregamento.

O desenvolvimento deste trabalho permitiu a consolidação dos conhecimentos obtidos no decorrer das aulas teóricas e práticas, constituindo uma experiência que será certamente valiosa num momento de futuro contacto com a área.
